

Assignment-V on JAVA programming

1. WAP in java to create two classes, one implementing the `Runnable` interface and the other extending the `Thread` class. Both classes should perform a similar task (e.g., printing numbers in a sequence). Create threads using both approaches and start them.
2. WAP in java that creates and starts multiple threads (at least 4). Each thread should perform a different task (e.g., calculating the factorial of a number, printing a specific message, etc.). Demonstrate how to manage these threads (e.g., using `join()` to wait for threads to complete).
3. WAP in java to create multiple threads with different priorities. Observe the effects of thread prioritization (if any) on their execution. Implement a scenario where shared resources are accessed by multiple threads (e.g., a counter variable).
